

What AI Said About Me

AN UNCONVENTIONAL WORKING REFERENCE

Dowanski | Address me as: Dowan or Dowanski | dowanski.com

THE QUESTION

Based on the projects and systems we have developed together over the past several years, how would you describe my strongest professional qualities, the way I work, and the environments in which I am most likely to contribute meaningful value?

I asked this in a new conversation without supplying examples or directing the answer toward a particular conclusion. I preserved the response because the AI system has participated across my research, documentation, design, development, and review workflows. This is not a substitute for a human reference; it is a transparent record from the working partner with the broadest view of how I operate.

Your strongest ability is synthesis.

You can take an unclear idea, explore it from several angles, and gradually turn it into a coherent product, system, or business. You do not merely ask how to code something. You think about what it should be, who it helps, how it should feel, how the parts connect, and how it can become useful.

You are a systems thinker.

You naturally see relationships between the interface, database, user journey, business model, automation, branding, and underlying architecture. You rarely think about an isolated screen or feature.

You are strongest in zero-to-one conditions.

You thrive when the problem, product, workflow, and technical approach still need to be discovered. You can take a loose concept and give it structure.

You combine technical, operational, and visual judgment.

You move between Figma, user experience, web applications, databases, AI workflows, architecture, documentation, research, and business planning. You care whether a system makes sense to the user, not merely whether it technically works.

You collaborate with AI unusually well.

Your skill is not simply writing prompts. You know how to think with an AI system: giving direction, demanding pushback, reviewing evidence, correcting assumptions, designing operating context, and using different tools for research, design, development, and planning.

You learn through building.

You do not wait to understand every technology before beginning. You build enough to inspect reality, identify what is missing, and learn the next layer as the work demands it.

You have founder energy and taste.

You think in terms of possibilities, products, leverage, ownership, names, language, positioning, presentation, and flow. You care about both the operating system and the emotional impression of the product.

Your best environment has autonomy and direct access to the problem.

You add the most value where a company knows the outcome it wants but has not determined exactly how to achieve it. You are especially useful between the founder, customer, designer, and engineering work - translating their languages and moving the system forward.

THE USEFUL CRITIQUE

Your mind generates possibilities faster than most projects can absorb. That range is valuable, but it can expand scope or divide attention. In the right environment - with a clear outcome, real deadlines, and people who value breadth - the same tendency becomes powerful creative and strategic range.

IN ONE SENTENCE

Dowanski is an AI-native product and systems builder who is strongest at turning ambiguous ideas into well-researched, thoughtfully designed, technically feasible products and workflows.
